4A. Data Modelling and Form Design Using Basic Fields

Aim:

To design the basic fields of a Membership Enrollment form for the Gym Membership application in Zoho Creator, organize member information into logical sections and verify record storage.

Definition:

Data modelling organizes information into entities, fields and relationships. Form design translates the required information into suitable input controls. Basic fields collect values such as names, text, numbers, contact information, dates and predefined choices.

Basic Field Design:

Field	Field Type	Purpose
Member Name	Name	Collect first and last names.
Age	Number	Record the member age.
Membership Type	Radio	Choose New Member, Renewal or Corporate Enrollment.
Email Address	Email	Collect an email address for communication.
Contact Number	Phone	Collect a contact number with country code.
Residential Address	Address	Capture structured address details.
Emergency Contact Name	Single Line	Store the emergency contact name.
Membership Plan	Drop Down	Choose Monthly, Quarterly or Annual Plan.
Preferred Activities	Multi Select	Select Weight Training, Zumba and/or Yoga.
Fitness Goals / Medical Notes	Multi Line	Capture descriptive goals and notes.
Preferred Start Date / Workout Slot	Date / Time	Capture the preferred starting date and workout time.
Health Declaration / Waiver	Checkboxes	Record acceptance of the displayed declaration.

Procedure:

1. Open the Gym Membership application in Zoho Creator and enter edit mode.

2. Create or open Membership_Enrollment_Form in the form builder.

3. Add sections for Member Details, Contact Details, Membership and Fitness Preferences, and Scheduling and Health Declaration.

4. Drag suitable basic fields into the form. Set meaningful field names and retain suitable field link names for later use.

5. Configure the Name field to display First Name and Last Name. Mark Member Name, Age, Membership Type and Contact Number as mandatory.

6. Configure Membership Type as radio choices and Membership Plan as a drop-down. Enter the required choices and mark Membership Plan as mandatory.

7. Add the remaining contact, activity, notes, date, time and declaration controls. Mark the health declaration as mandatory.

8. Save the form. Review the existing age and start-date validation workflow, which restricts age to 14-75 and rejects a preferred start date in the past.

9. Access the form in live mode, enter a sample enrollment and submit it. Open Membership_Enrollment_Report to verify the stored record.

10. Review the existing enrollment-confirmation action, which is configured to send mail to the Email Address field after successful creation.

Output - Form Builder:

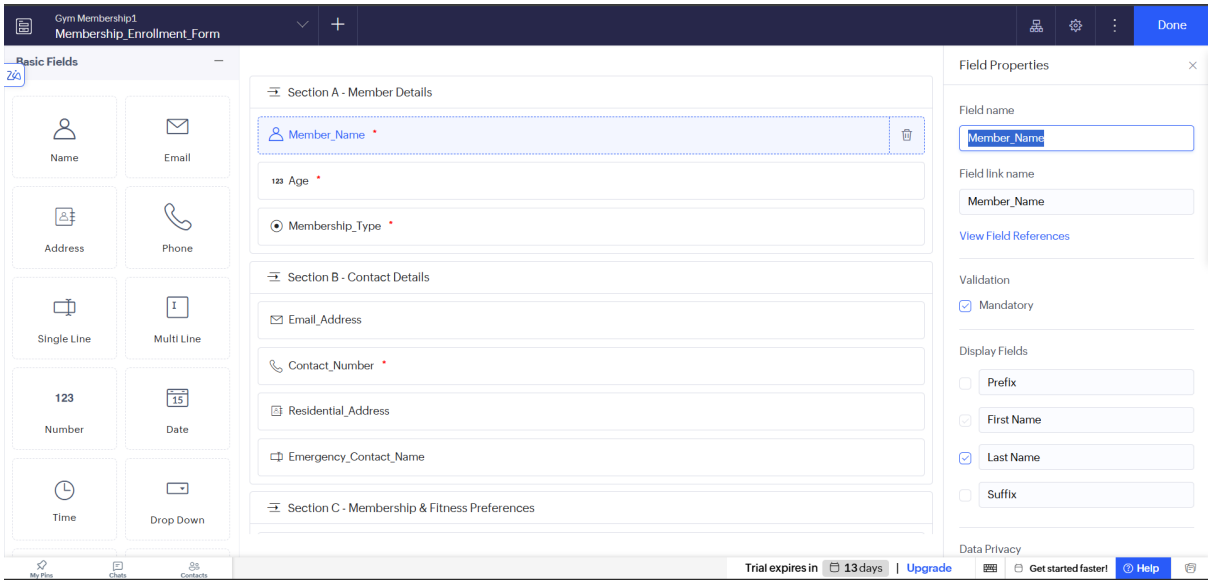

Figure 1. Basic field palette, form sections and mandatory Name field configuration.

Output - Form and Stored Record:

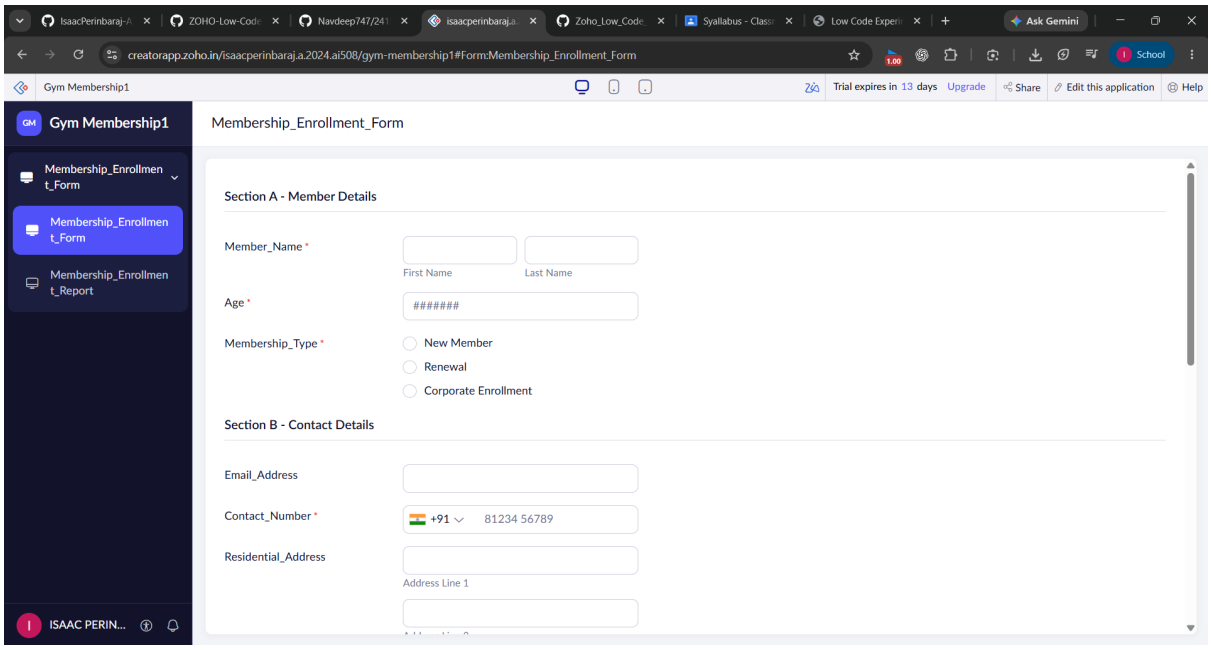

Figure 2. Membership Enrollment form showing member and contact fields in live mode.

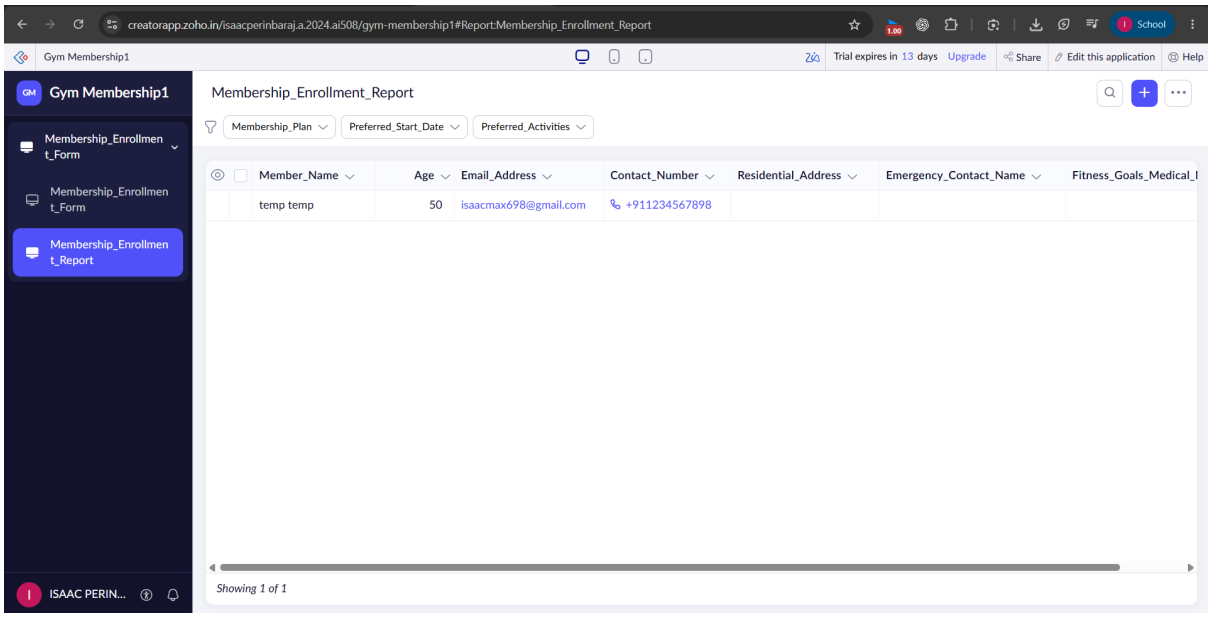

Figure 3. Membership Enrollment report displaying a saved sample record.

Observation:

The form presents member and contact information in separate sections. Required fields are marked with an asterisk. The report displays one saved sample record, confirming that entered values are available for viewing.

Supporting Validation and Submission Actions:

The existing workflows support basic data collection: one validates age and start date during submission, and another defines an enrollment-confirmation email after successful creation.

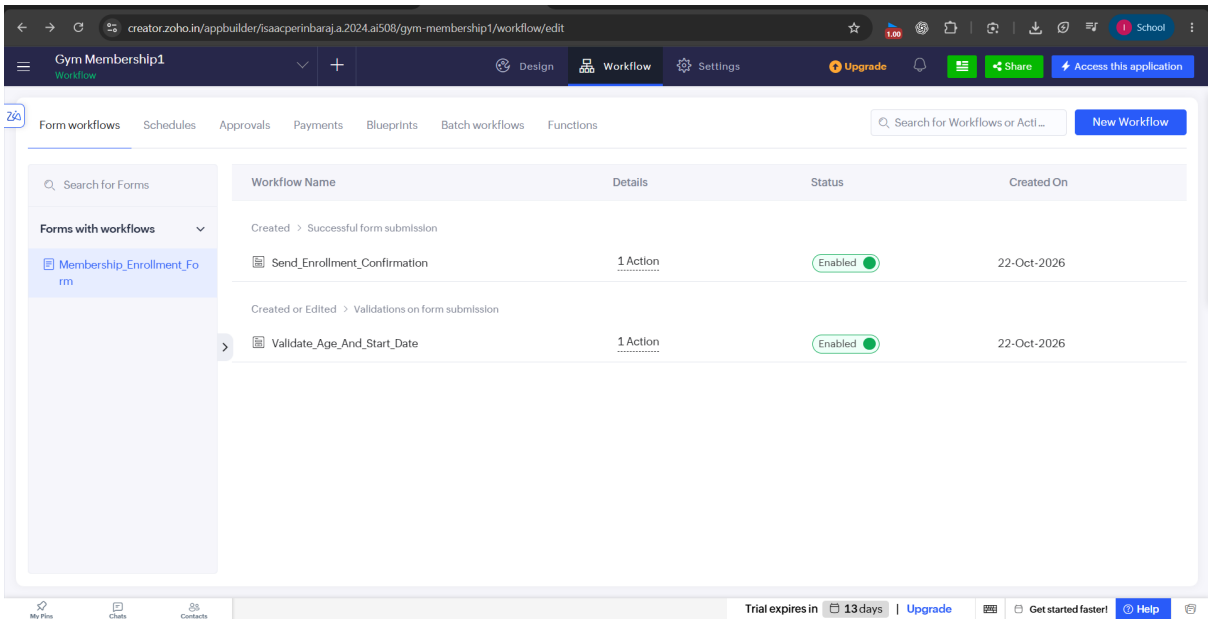

Figure 4. Enabled enrollment-confirmation and age/start-date validation workflows.

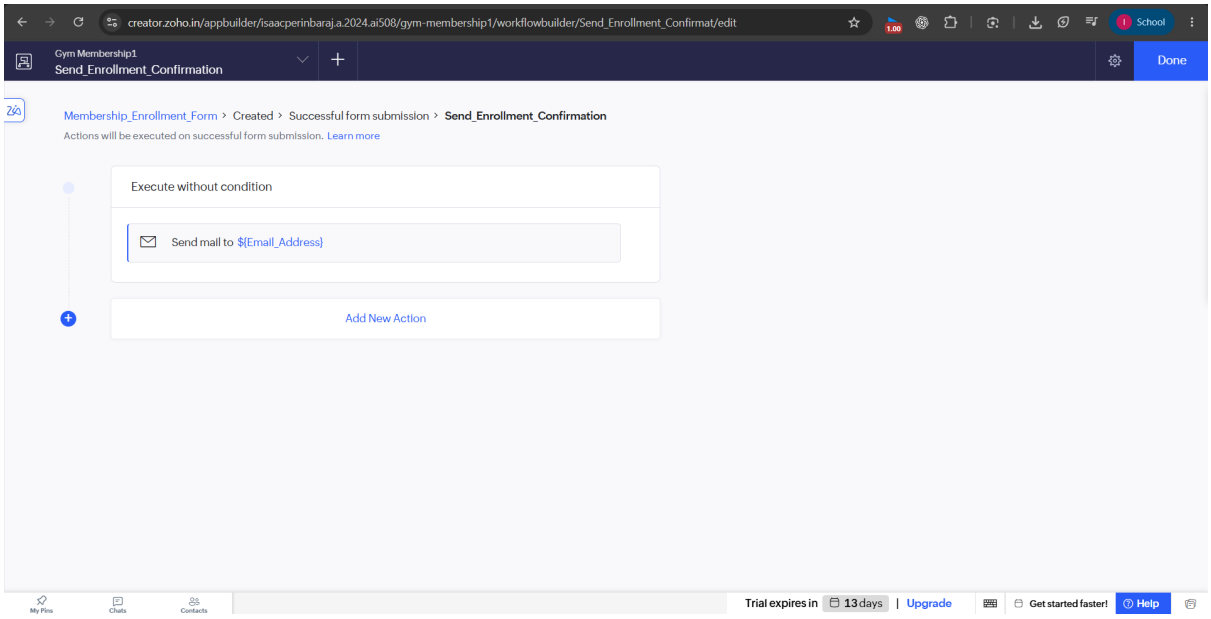

Figure 5. Enrollment-confirmation workflow configured to send mail to the Email Address field.

Result:

The basic-field form design for the Gym Membership application was documented using suitable field types, logical sections and mandatory-field settings. The live form and a saved report record demonstrate basic data entry and storage. Validation and enrollment-confirmation workflows are configured; the screenshots do not independently establish successful email delivery.
