9. Exploring AI-Assisted Features and Built-in Analytics in Zoho Creator

Aim:

To explore Zia feature access, AI-assisted review of Gym Membership forms and Deluge workflows, dashboard suggestions and built-in analytics using membership-plan counts.

Definition:

Zia provides AI-assisted capabilities within Zoho Creator. AI responses can help draft, explain or improve application components, but require review before use. Built-in charts and pivot reports summarize application records; an ordinary chart is not by itself proof that AI generated the analysis.

Procedure:

1. Open the Creator administration area and locate Zia under the available settings or Operations navigation.

2. Open Features and inspect the provider and access settings. Confirm that Deluge Assistance is enabled for the relevant account.

3. Open Membership Enrollment in the form builder and use the Build Agent to request form-improvement suggestions.

4. Review suggestions about field instructions, calculated amounts, renewal dates, duplicate prevention and sensitive-data access. Apply only changes that match the business rules.

5. Open Validate_Age_And_Start_Date and request a review for error handling, performance and readability without changing its intended functionality.

6. If the assistant cannot locate the script, provide the exact workflow context or script content and request clarification. Do not treat the initial response as a completed code review.

7. Open Gym Command Center and request dashboard improvements. Inspect proposed changes before selecting Apply Changes.

8. Open the Plan Popularity Chart and use Membership Plan as the category and member count as the measure. Inspect the totals against the pivot or source records.

9. Record which AI features were enabled, which suggestions were produced, which changes were actually applied and what the analytics display.

Output - Zia Features and Form Assistance:

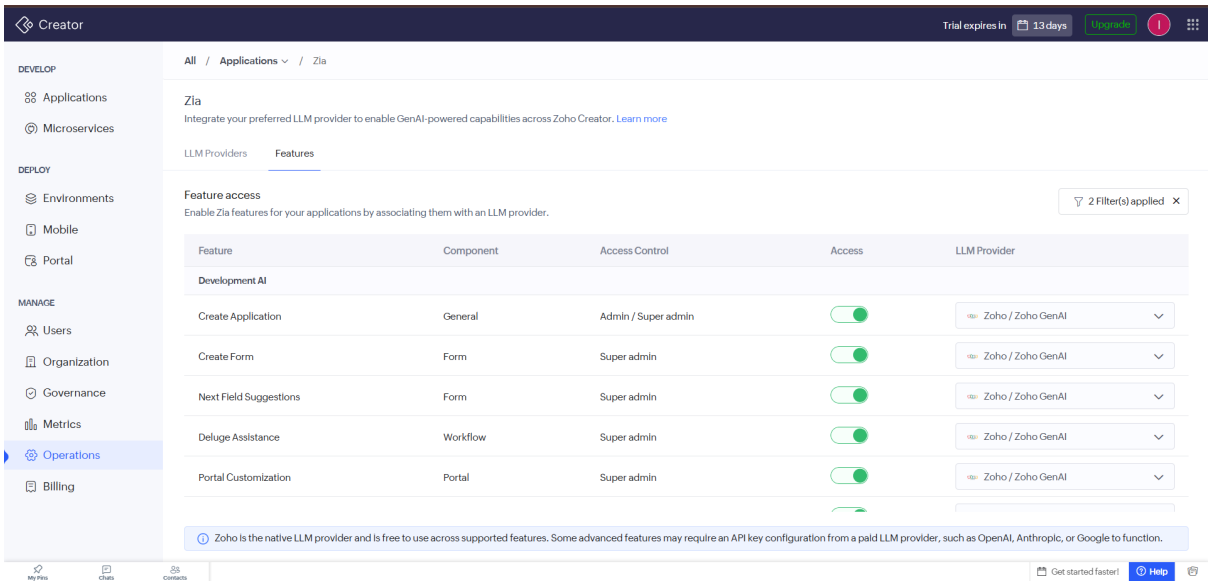

Figure 1. Zia Features showing enabled Deluge Assistance and Zoho / Zoho GenAI as provider.

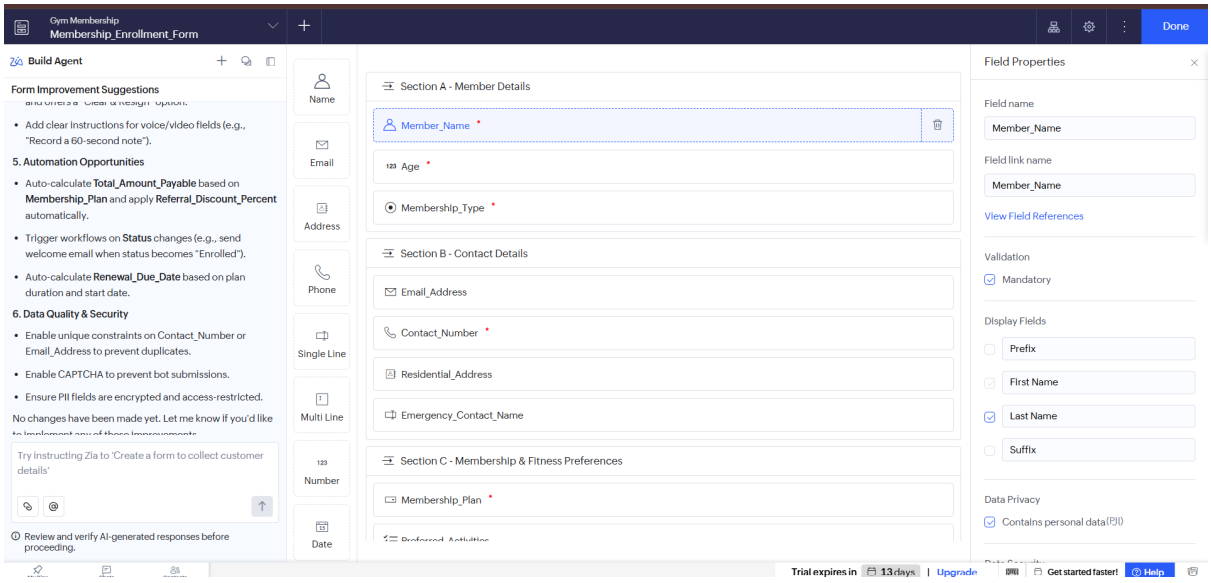

Figure 2. Build Agent form-improvement suggestions alongside Membership Enrollment field properties.

The form response proposes automation and data-quality changes and explicitly states that no changes have been made yet. It demonstrates AI assistance and review, rather than implementation of the suggested improvements.

Output - Script Review and Dashboard Suggestions:

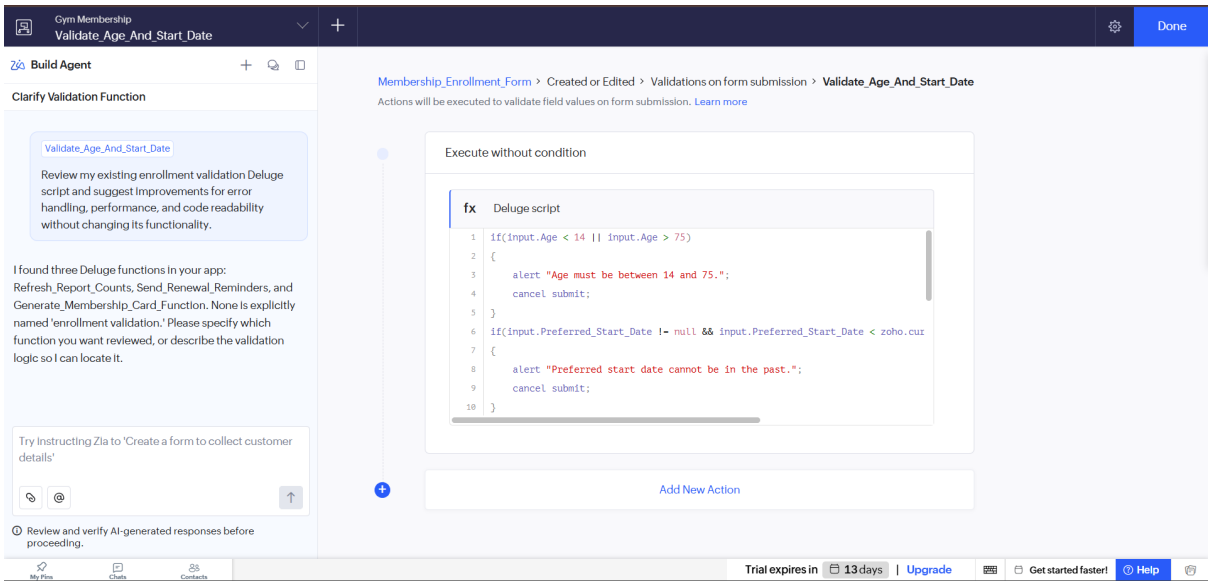

Figure 3. Validation workflow and AI clarification request while reviewing existing Deluge logic.

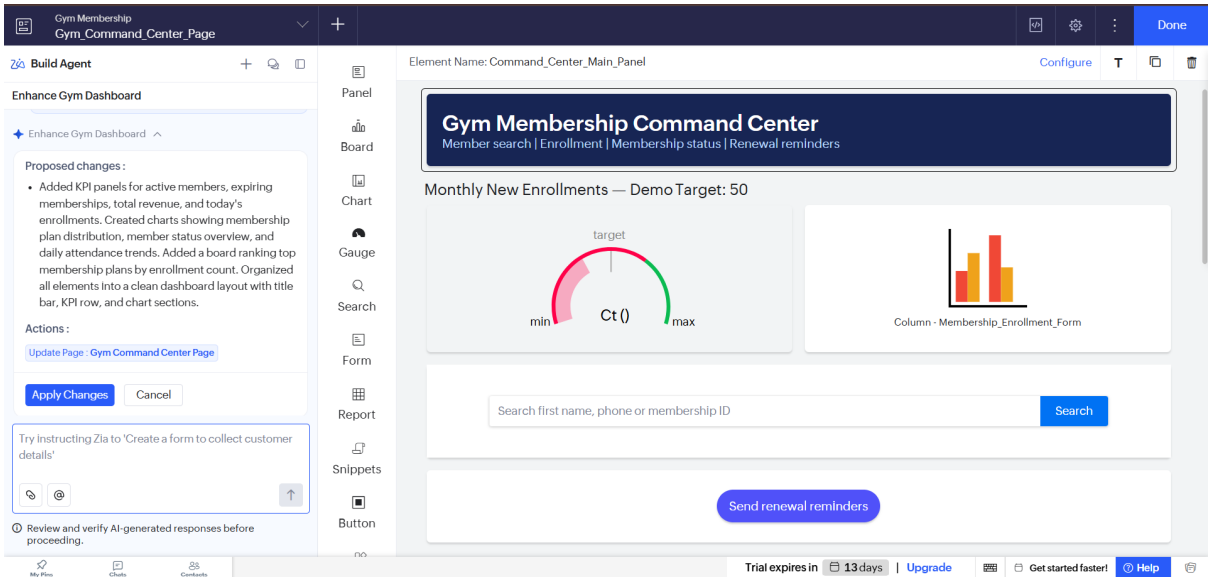

Figure 4. AI-proposed dashboard enhancements awaiting Apply Changes.

The script-review response asks the user to clarify which function or validation logic should be reviewed. The visible script contains age and starting-date checks, but the response does not establish a completed AI rewrite. The dashboard screen shows a proposed update; application of the changes is not confirmed.

Output - Built-in Analytics:

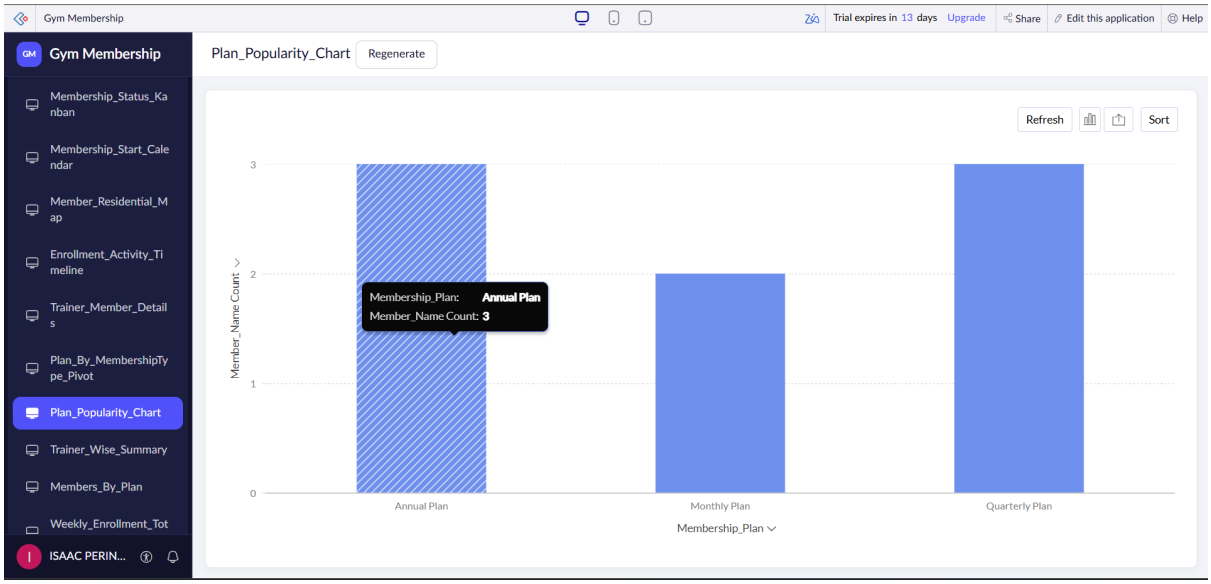

Figure 5. Plan Popularity Chart displaying Annual: 3, Monthly: 2 and Quarterly: 3 members.

Observations:

Area	Finding
AI access	Deluge Assistance and other listed development features are enabled in the supplied feature screen.
Form assistance	Recommendations were generated for automation, field guidance and data quality. They remain suggestions in the captured view.
Workflow assistance	The assistant requested clarification; the record should not claim that a replacement validation script was generated.
Dashboard assistance	An update proposal includes KPI panels and charts, with an Apply Changes control still visible.
Analytics	The plan chart totals eight members: three Annual, two Monthly and three Quarterly. It is a built-in report output.

Result:

Zia feature settings, form suggestions, workflow-assistance interaction and dashboard recommendations were explored for Gym Membership. Built-in analytics visualized the distribution of eight members across three plans. The screenshots establish AI suggestions and chart output; they do not establish that the proposed changes or an AI-generated validation rewrite were applied.
