7. Integrating Gym Membership with Zoho CRM Using Connections and APIs

Aim:

To configure a Zoho CRM connection for the Gym Membership application and use an enrollment workflow to transfer member contact details to the CRM Contacts module.

Definition:

A connection provides authorized access to an external service without embedding credentials in application scripts. A Deluge integration task can send a map of field values to a Zoho CRM module and return a response for validation and error handling.

Procedure:

1. Open Zoho Creator and select the Gym Membership application.

2. Navigate to Microservices and Connections. Create or review the Zoho CRM connection named Gym CRM Contacts, with link name gym_crm_contacts.

3. Authorize the appropriate CRM account and grant the required Create Contact permission. Enable connection access for Gym Membership.

4. Open Membership_Enrollment_Form and configure Sync_Enrollment_To_Zoho_CRM to run after a record is successfully created.

5. Prepare a map containing the member name, email and contact number using the corresponding CRM field API names. Ensure the required Last_Name value is populated.

6. Use the zoho.crm.createRecord integration task with Contacts, the contact map, an options map and the authorized connection. Capture the response and check whether a record ID or an error is returned.

7. Submit a controlled test enrollment. Inspect the workflow result and search for the corresponding contact in Zoho CRM.

8. Open the created contact and compare its name, email and phone with the test values. Review duplicate handling before enabling repeated submissions or retries.

Field Mapping:

Creator Information	CRM API Field	Mapping Requirement
Member name	First_Name / Last_Name	Map name parts appropriately; CRM requires Last_Name.
Email Address	Email	Transfer the intended contact email.
Contact Number	Phone	Preserve the country code and number.

Output - Connection and Enrollment Workflow:

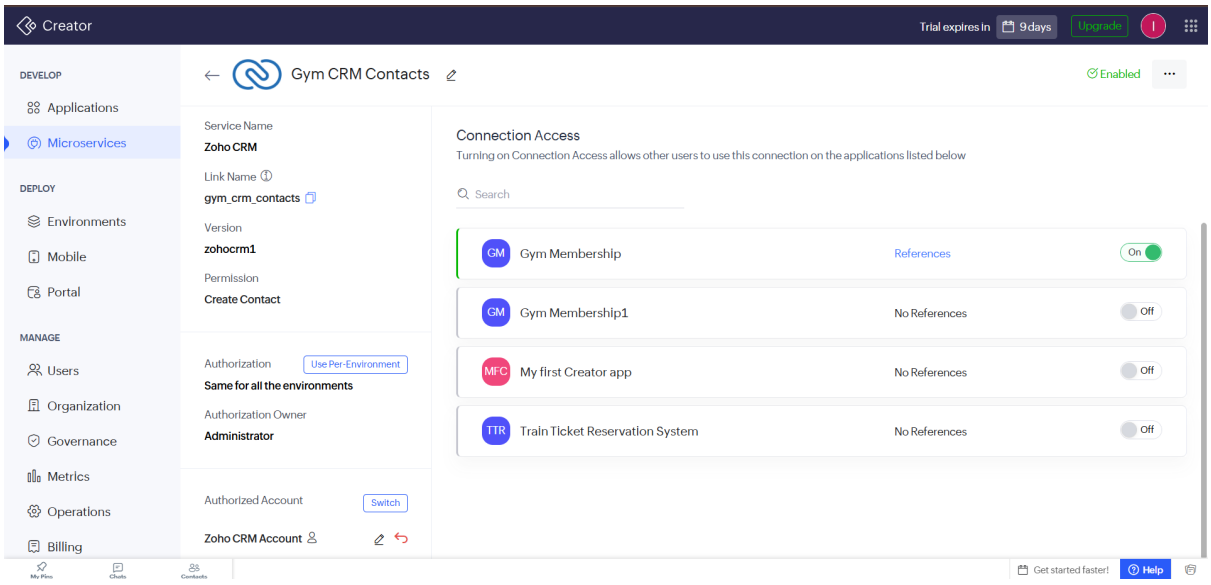

Figure 1. Enabled Gym CRM Contacts connection with Create Contact permission and Gym Membership access.

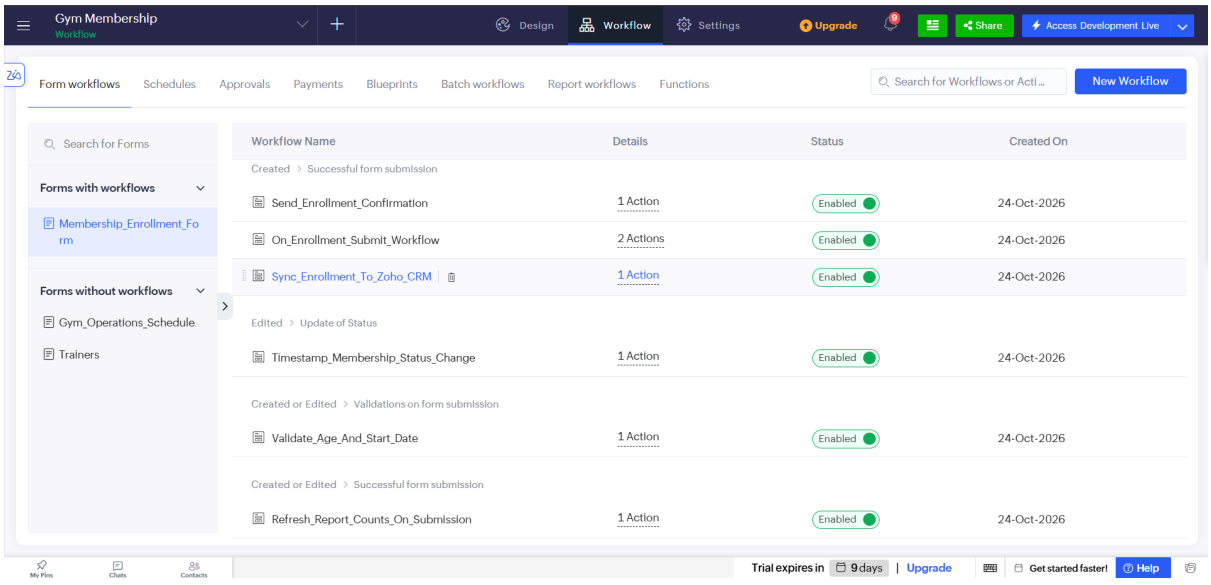

Figure 2. Enabled Sync Enrollment to Zoho CRM workflow on successful record creation.

The connection link name is gym_crm_contacts. Access is On for Gym Membership and Off for the other displayed applications. The workflow list identifies the enrollment-to-CRM action and its trigger.

Output - Zoho CRM Contact:

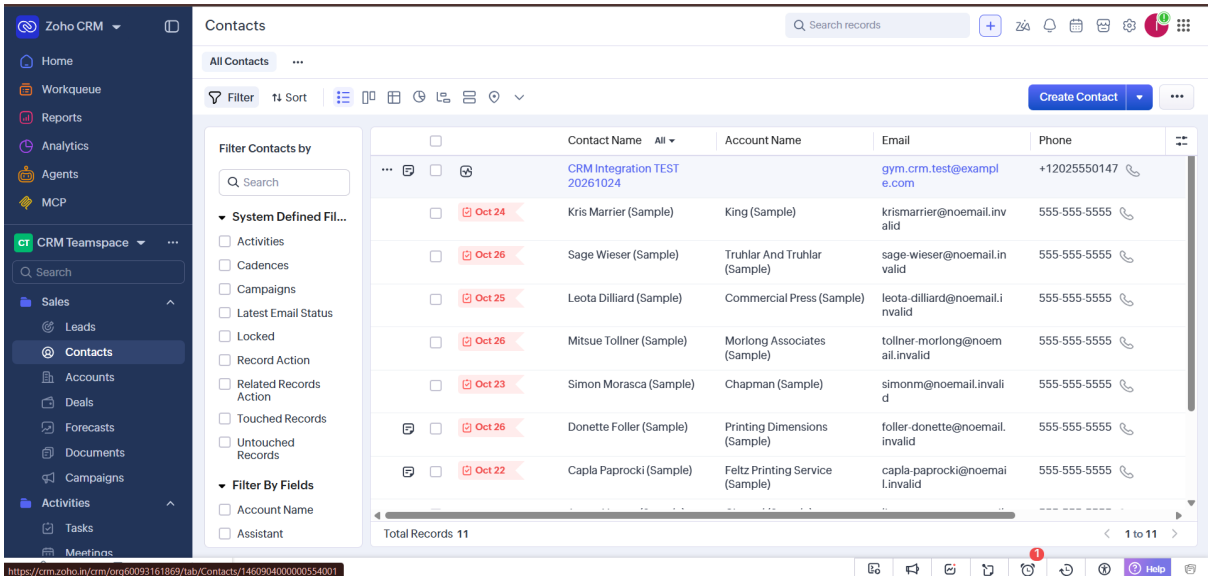

Figure 3. CRM Contacts list showing the test contact CRM Integration TEST 20261024.

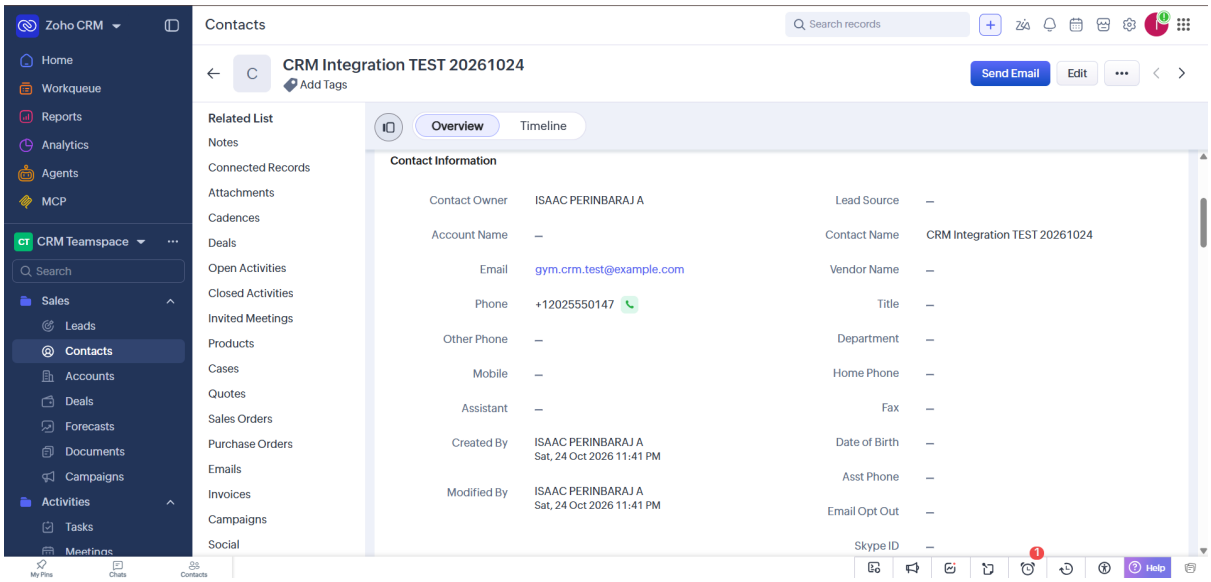

Figure 4. Test contact details showing its name, email and phone.

Result:

The CRM connection and enrollment-sync workflow were configured for Gym Membership, and the test contact is present in Zoho CRM with the expected displayed contact details. The screenshots document configuration and destination output; the workflow script, API response and matching Creator submission are not shown separately.
