8. User Management and Role-Based Access Control

Aim:

To organize Gym Membership application access using roles, permission sets and hierarchy, and review the user assignments required to verify role-based restrictions.

Definition:

Role-Based Access Control assigns access according to user responsibilities. Permission sets define allowed component and field operations. Roles describe an organizational hierarchy, while data-sharing rules can extend record access. A role name alone does not establish which operations or records a user can access.

Procedure:

1. Open Gym Membership and navigate to Settings, User Permissions.

2. Review the Front Desk, Manager and Member_Permissions permission sets. Configure access to the required forms, reports and pages.

3. For Front Desk, retain operational access and restrict export, print and non-operational edits according to the intended policy.

4. For Manager, configure the required wider member-record access and authorized export operations.

5. For members, restrict access to their own permitted enrollment information and exclude staff dashboards and sensitive health data as required.

6. Open Roles and establish CEO, Gym Manager, Front Desk and Member positions. Configure Front Desk to report to Gym Manager.

7. Review the Share Data with Peers option and leave it disabled for Front Desk when peer sharing is not required.

8. Review Data Sharing and form hierarchy settings against the required record-access policy. Do not assume own-record isolation from a permission-set description alone.

9. Open Manage Users and assign authorized users to the intended application roles and permission sets.

10. Using separate authorized accounts, verify allowed operations, denied operations, exports, direct record links and sensitive-file access. Save the configuration and document the test results.

Output - Permission Sets and Role Hierarchy:

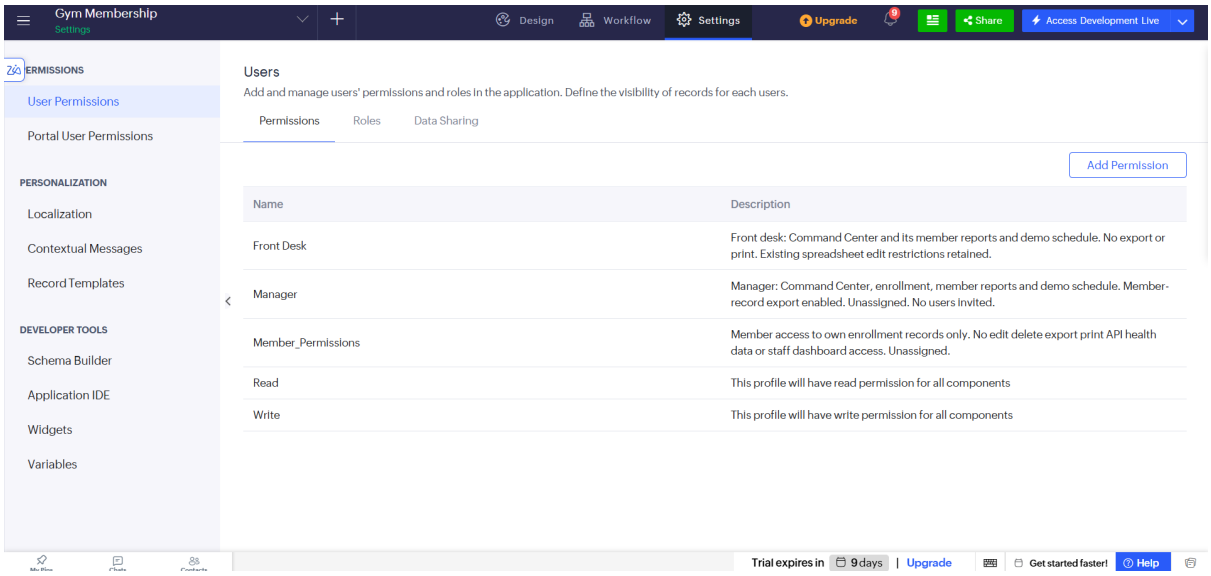

Figure 1. Front Desk, Manager and Member Permissions entries with their configured descriptions.

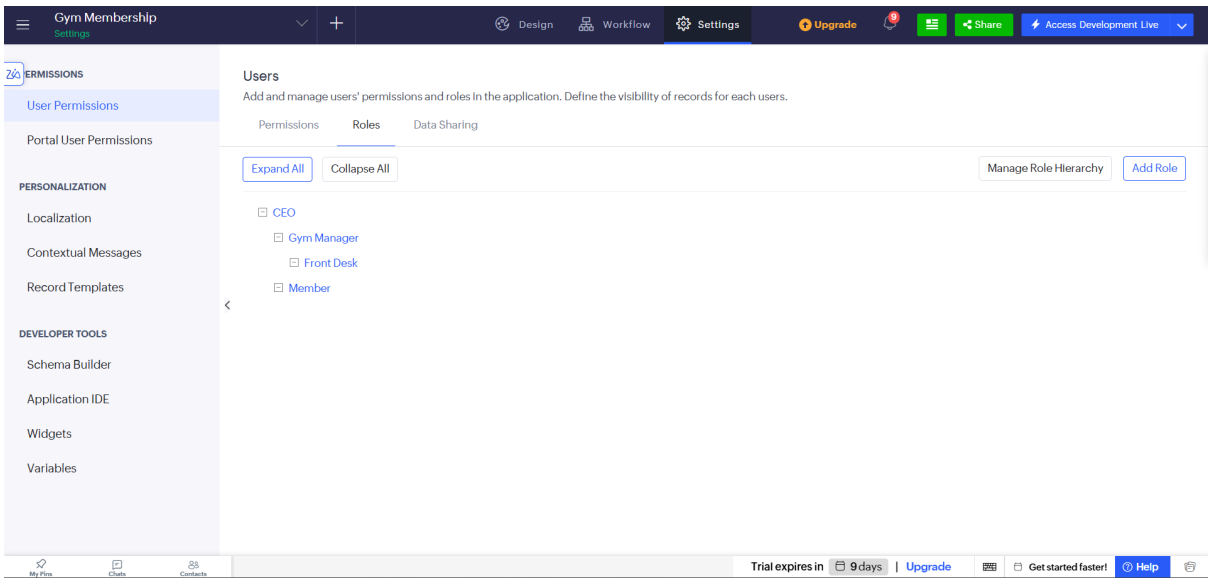

Figure 2. Role hierarchy showing CEO, Gym Manager, Front Desk and Member.

Front Desk is nested under Gym Manager. Member appears under CEO on a separate branch. The permission list describes the intended access; individual operation and record-access tests must confirm actual enforcement.

Output - Front Desk Role Configuration:

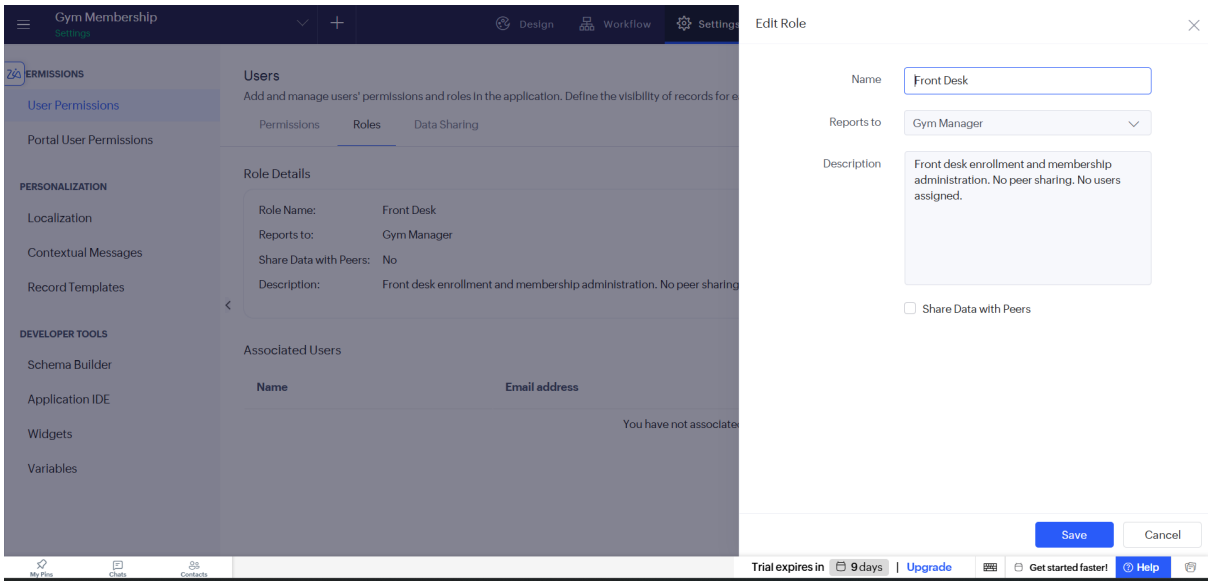

Figure 3. Front Desk role editor showing Gym Manager as its parent and peer sharing unchecked.

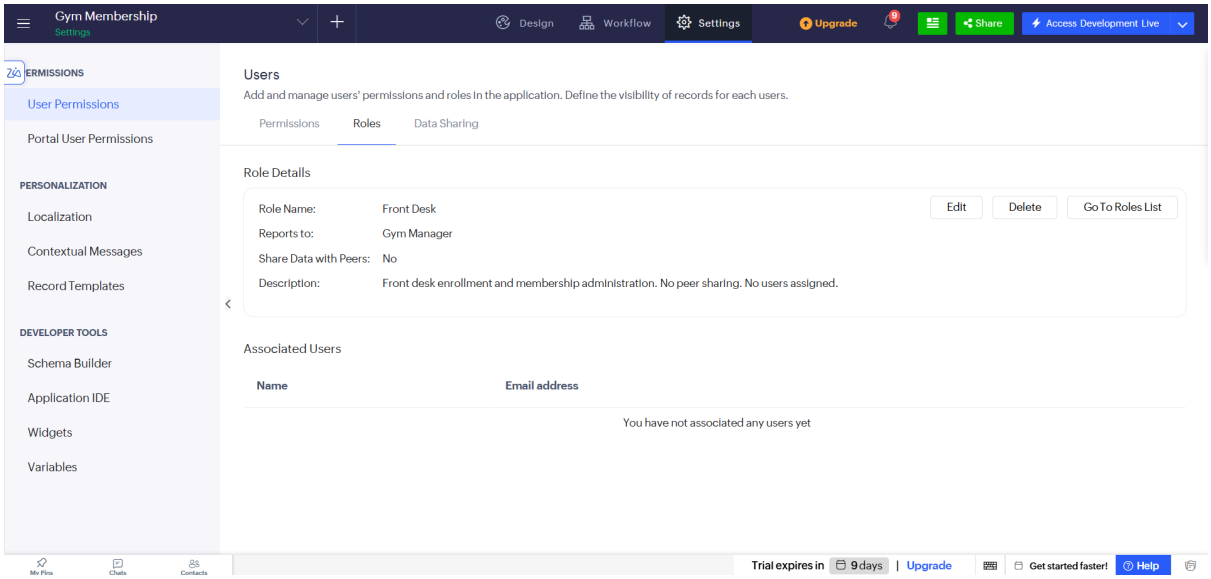

Figure 4. Saved Front Desk role details showing no peer sharing and no associated users.

The saved role reports to Gym Manager and has Share Data with Peers set to No. The Associated Users area explicitly states that no users have been associated yet.

Output - User Management:

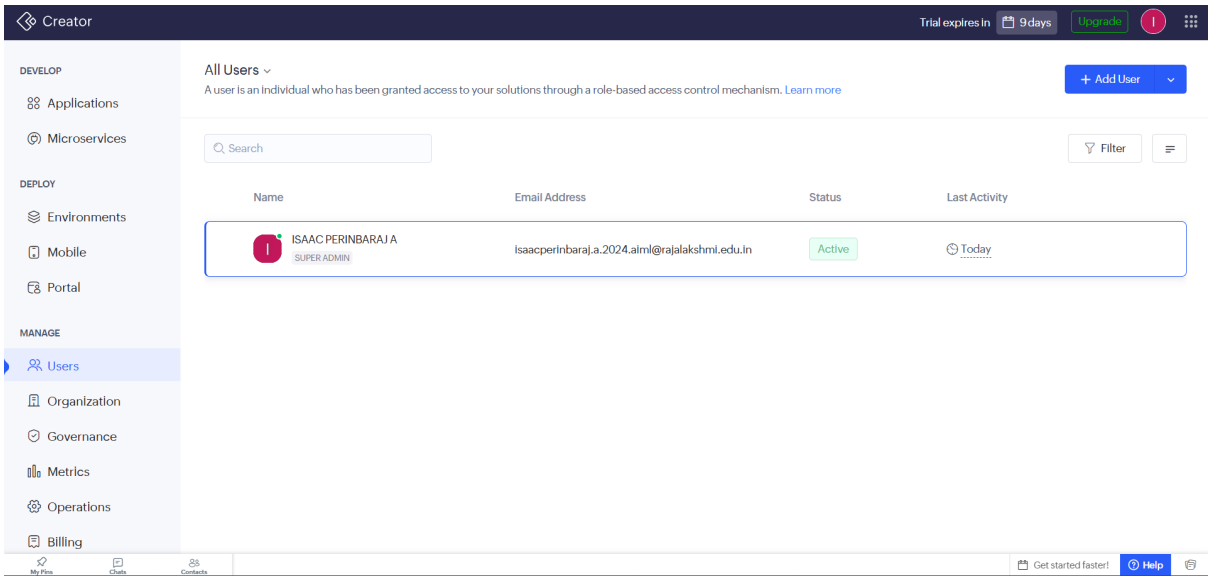

Figure 5. All Users screen showing the active Super Admin account.

Verification Status:

Item	Observed Status
Permission-set definitions	Front Desk, Manager and Member_Permissions are listed.
Hierarchy	CEO, Gym Manager, Front Desk and Member roles are visible.
Peer sharing	Disabled for the Front Desk role.
Role assignment	Front Desk has no associated users; Manager and Member descriptions also indicate unassigned status.
User-specific access tests	Not shown. The visible Super Admin account cannot demonstrate restrictions for other roles.
Data-sharing rules	The Data Sharing tab is available, but its rule configuration is not included in these screenshots.

Result:

Gym Membership roles, permission-set definitions and the Front Desk reporting hierarchy were configured and documented. User management shows an active Super Admin account. Assignment of staff/member accounts and verification of their effective record and operation restrictions remain pending; successful multi-user RBAC enforcement is not claimed.
