11. Deploying Gym Membership from Development to Stage and Production

Aim:

To publish the Gym Membership application through Stage to Production using Zoho Creator Environments and verify the published version through environment status, version history and completion notifications.

Release Details:

Item	Recorded Value
Application	Gym Membership
Version title	Gym Membership 1.1 - Experiment 11
Version / type	1.1 / Minor
Change description	Add a release-information function and promote Gym Membership from Development to Stage and Production.
Testing note	Functional testing deferred, as stated in the version-history description.

Definition:

Environments separate application development, pre-production testing and production use. Publishing promotes selected application changes as a version. A successful publication confirms release processing; it does not by itself demonstrate that all application features passed functional testing.

Procedure:

1. Open Zoho Creator and select Gym Membership.

2. Navigate to Environments and review available development changes.

3. Save the intended application changes and review their dependent components.

4. Choose Publish to Stage and select the required application components.

5. Enter a version title, description and suitable version type. Review the publishing checks and publish to Stage.

6. Confirm the Stage version and inspect the publication-completion notification.

7. Test forms, validations, workflows, reports, dashboard components and connections in Stage before a normal production release.

8. Publish the approved Stage version to Production and inspect the resulting completion notification.

9. Review Environments and Version History to confirm that Stage and Production show the intended version.

10. Perform production smoke tests and retain the release notes and test evidence. In this captured exercise, the version description records that functional testing was deferred.

Output - Environments and Version History:

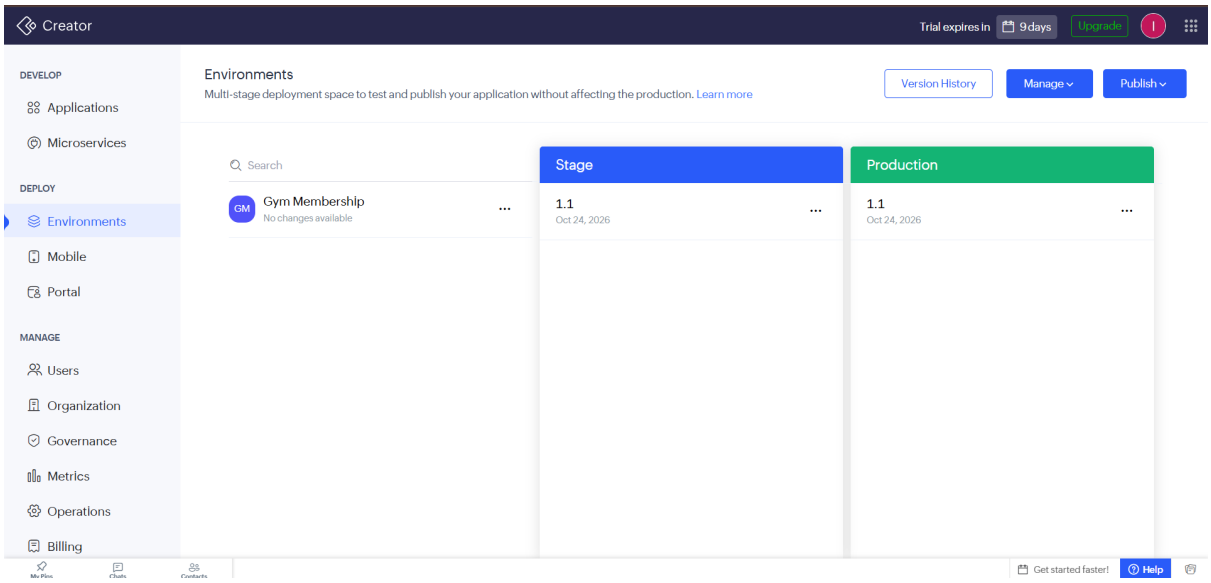

Figure 1. Environments screen showing Gym Membership version 1.1 in both Stage and Production.

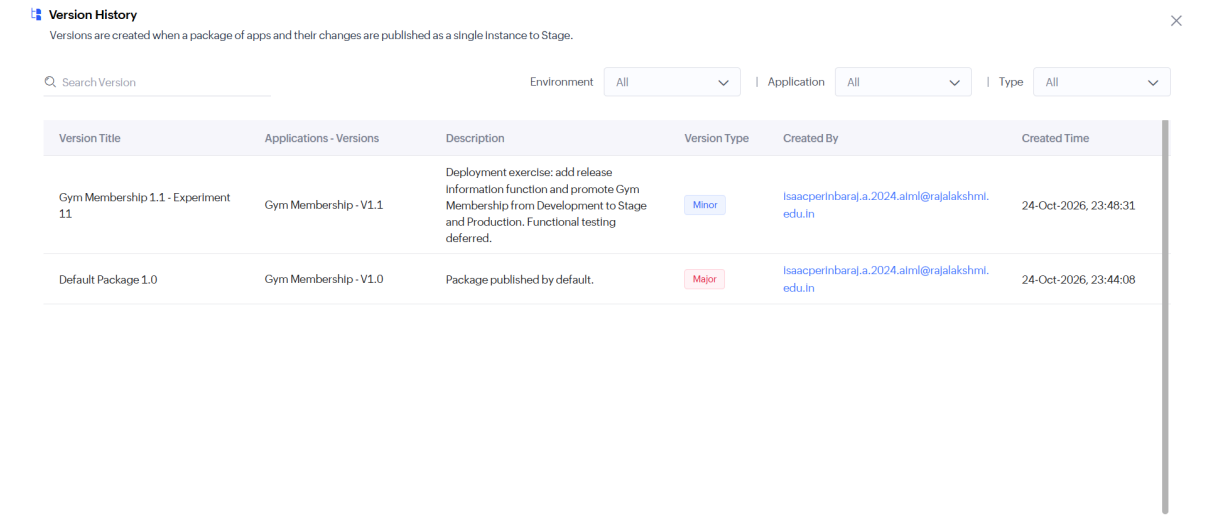

Figure 2. Version History showing the 1.1 minor release and its deployment description.

The environment overview shows no available development changes. Version History lists the 1.1 deployment exercise alongside the default 1.0 package, with the note that functional testing was deferred.

Output - Publication Completion:

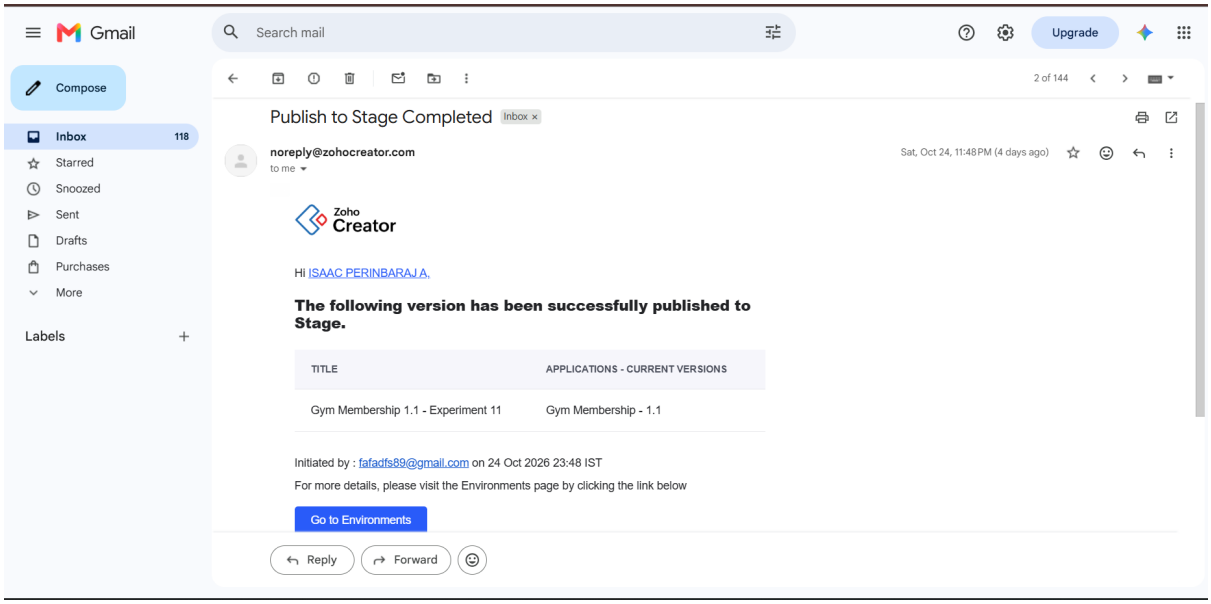

Figure 3. Zoho Creator notification confirming successful publication of version 1.1 to Stage.

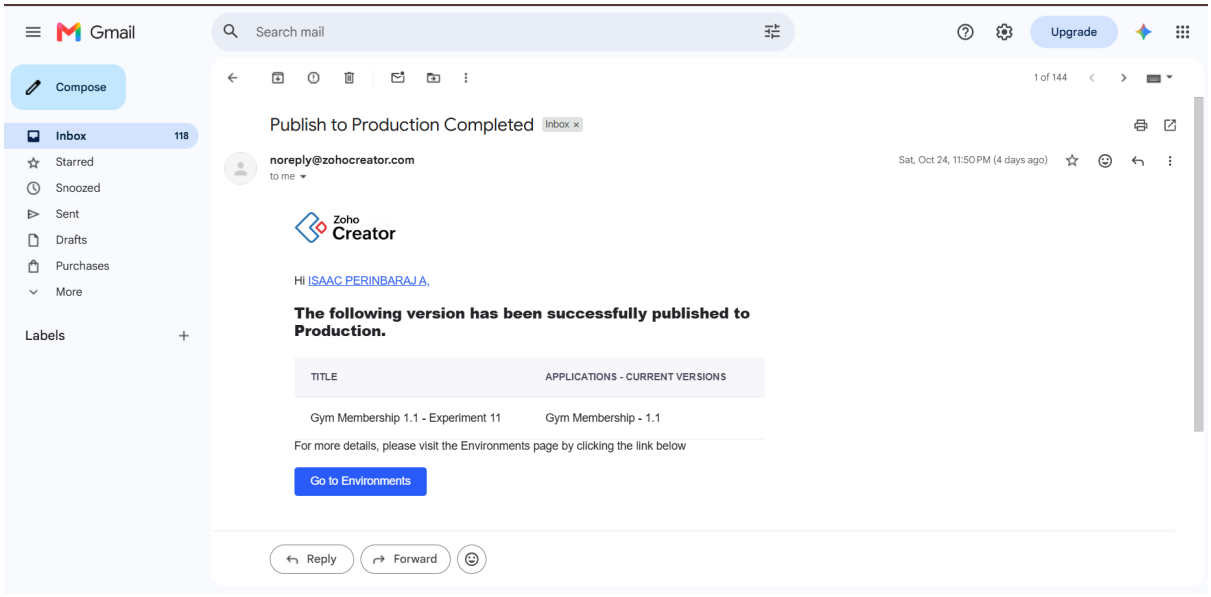

Figure 4. Zoho Creator notification confirming successful publication of version 1.1 to Production.

Result:

Gym Membership version 1.1 was successfully published to Stage and Production. The environment overview, version history and completion emails establish the deployment and version-management outcome. Functional validation of forms, workflows, reports and dashboard behavior remains separate from publication and was deferred in the recorded exercise.
